MAPS

- Maps can be subdivided into two broad categories:
 - ◆ general: designed for general use, contain multiple features
 - ◆ thematic: designed for a specific audience, present a specific set of data values
- Different thematic maps are designed for different types of data and analysis tasks
 - ◆ choropleth, display data values aggregated over regions
 - ◆ isarithmic, display contour lines of equal value
 - ◆ proportional symbol, display symbols sized to represent data values at geographic locations
 - ◆ dot, display presence of an event at a geographic location
 - ◆ dasymetric, warp a map so area represents a data value

THEMATIC MAPS

- Traditional method for presenting geographic and geospatial data
 - ◆ E.g., topographic, planimetric, base
- Different maps are used for different tasks:
 - ◆ choropleth (charting value distributed by region)
 - ◆ isarithmic (contour lines)
 - ◆ proportional symbol (point location data)
 - ◆ dot (presence or absence of a feature)
 - ◆ dasymetric (regions warped to match data values)
- Maps can be extended to visualize multidimensional data

Topographic map from Indiana Jones and the Last Crusade
